                                                     The present invention relates to a new recombinant construct. The construct comprises a promoter operably linked to a DNA sequence which when expressed by a host produces an RNA having homology to at least one target mRNA expressed by the host and complementary RNA regions. The recombinant construct is useful for reducing the expression of a target mRNA or any similar endogenous mRNA. The RNAs expressed from the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           recombinant constructs are also used in reducing expression of a target mRNA or any similar endogenous mRNA. The sequences and their reverse complements can be used to reduce the expression of any endogenous genomic sequence that shares substantial similarity to nucleic acid fragment which is in proximity to the DNA or RNA sequence derived from it. The present sequence is 2X ELVISLIVES complementary repeat region DNA found in plasmid pKS133 used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       construct comprises a promoter operably linked to a DNA sequence which when expressed by a host produces an RNA having homology to at least one target mRNA expressed by the host and complementary RNA regions. The recombinant construct is useful for reducing the expression of a target mRNA or any similar endogenous mRNA. The RNAs expressed from the
                                                                                                                                                                                                                                                                                                   Unidentified

proteins and polynucleotides encoding such proteins. The nucleic acid sequences may be used to increase the level of unsaturation in cellular lipids, including oil, in tissues when the enzyme is absent or rate-initing, to isolate cDNAs and genes encoding homologous proteins from the same or other plant species and to create transgenic plants in which the golypeptides are present at higher or lower levels than normal or in cell types or developmental stages in which they are not normally found, thus altering the level of mono, poly- and unsaturated fatty acids in those cells. They are useful as probes for genetic and physical gene mapping and as markers, e.g. restriction fragment length polymorphism (RFLP) markers. The peptides can be used to immunise animals to produce is IX ELVISLIVES complementary repeat region DNA found in plasmid pKS133 This sequence is used in the exemplification of the invention for the

                                                                                                                                                                                                                                                                                              Ş
                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to diverged delta-9 fatty acid desaturase proteins and polynucleotides encoding such proteins. The nucleic acid sequences may be used to increase the level of unsaturation in cellular lipids, including oil, in tissues when the enzyme is absent or rate-1 limiting, to isolate cDNAs and genes encoding homologous proteins from the same or other plant species and some the transgenic plants in which the polypeptides are present at higher or lower levels than normal or in cell types or developmental stages in which they are not normally found, thus altering the level of mono-, poly- and unsaturated fatty acids in those cells. They are useful as probes for genetic and physical gene mapping and as markers, e.g. restriction fragment length polymorphism (RPIP) markers. The peptides can be used to immunise animals to produce antibodies specific for the peptides and proteins. The present sequence is 1X ELVISLIVES complementary repeat region DNA found in plasmid pKS133 This sequence is used in the exemplification of the invention for the

Decreasing ratio of liquiritigenin-derived isoflavones relative to tot isoflavones in a plant comprises transforming plant cell with nucleic acid sequence showing homology to sequence encoding chalcone reductase (deoxychalcone synthase). total

Example 7; SEQ ID NO 7; 25pp; English.

The invention relates to decreasing the ratio of liquiritigenin-derived construct comprising transforming a plant cell with a recombinant construct comprising a promoter operably linked to a nucleic acid construct comprising a promoter operably linked to a nucleic acid construct comprising a promoter operably linked to a nucleic acid construct comprising a promoter operably linked to a nucleic acid construct comprising a promoter operably linked to a nucleic acid construct comprising a promoter operably linked to a nucleic acid construct to ADQ07965 (a soybean chalcome reductase cDNA). Also included correct an isoflavonoloproducing plant made by the method above, seeds or company a reduced ratio of liquiritigenin-derived isoflavones relative to the total isoflavone levels obtained from the seeds or plant parts, a construct of the isoflavonoid-containing product, and a method of producing an isoflavonoid-containing product, and a method of convoluting an isoflavonoid-containing product, and a method of convoluting an isoflavonome relative to the total isoflavone convolution of liquiritigenin comprises a stem-loop structure. The nucleic acid sequence forms a loop in the stem-loop structure and the component of the methods and recombinant construct are useful in correct is a seed-specific producing an isoflavones relative to the total isoflavone in an isoflavone-convolution plant. The methods and recombinant construct are useful in correct health food product, infant formula, baked good product, fried food correal food product, infant formula, baked good product, fried food correct infant formula. product, health food product, infant formula, beverage, nutritional supplement, dairy product, pet food product, or animal feed. The prosequence is the single stranded version of the stem loop region from plasmid pKS151. The present

The sequences are useful for producing a CC transgenic plant, by transforming a plant cell with a polynucleotide of CC the invention and regenerating a plant from the transformed plant cell. CC polynucleotide fragments are useful for suppressing the level of CC expression of a gene encoding a polypeptide having plastidic phosphoglucomutase activity. An isolated polynucleotide that affects the CC level of expression of a plastidic phosphoglucomutase polypeptide in a CC plant cell can be identified by introducing a DNA fragment comprising at CC least 541 nucleotides, measuring the level of the polypeptide in the plant cell containing the polynucleotide, and comparing the level of the polypeptide with CC plant cell containing the polynucleotide, and comparing the level of the polypeptide in a plant cell that does not contain the CC polypeptide in the plant cell containing the isolated polynucleotide with CC the level of the polypeptide in a plant cell that does not contain the CC isolated polynucleotide. A method for altering the level of expression of a plastidic phosphoglucomutase protein in a host cell comprises CC transforming a host cell with a chimeric gene and growing the transformed CC cell under conditions that are suitable for expression of the chimeric genes of plastidic phosphoglucomutase. This sequence represents an CC artificial DNA used for plasmid construction, in the methods of the CC invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to plastidic phosphoglucomutase polypeptides and CC their related nucleic acids. The sequences are useful for producing a CC transgenic plant, by transforming a plant cell with a polynucleotide of CC the invention and regenerating a plant from the transformed plant cell. CP polynucleotide fragments are useful for suppressing the level of CC expression of a gene encoding a polypeptide having plastidic CC phosphoglucomutase activity. An isolated polynucleotide that affects the CC level of expression of a plastidic phosphoglucomutase polypeptide in a CC level of expression of a plastidic phosphoglucomutase polypeptide in the level of the polynucleotides, measuring the level of the polypeptide in the CC plant cell containing the polynucleotide, and comparing the level of the contain the CC polypeptide in the plant cell containing the isolated polynucleotide with CC the level of the polypeptide in a plant cell that does not contain the CC isolated polynucleotide. A method for altering the level of expression of CC a plastidic phosphoglucomutase protein in a host cell comprises of cc launder conditions that are suitable for expression of the transformed CC cell under conditions that are suitable for expression of the chimeric gene, where the expression of the gene results in production of altered clevels of plastidic phosphoglucomutase. This sequence represents an of invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         mRNA or any similar endogenous mRNA. The RNAs expressed from the recombinant constructs are also used in reducing expression of a target mRNA or any similar endogenous mRNA. The sequences and their reverse complements can be used to reduce the expression of any endogenous genomic sequence that shares substantial similarity to nucleic acid fragment which is in proximity to the DNA or RNA sequence derived from it. The present sequence is 1X ELVISLIVES complementary repeat region DNA found in plasmids pKS106 and pKS124 used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New recombinant construct having a promoter operably linked to a DNA sequence which when expressed produces an RNA having homology to a target mRNA and its reverse complement unrelated to endogenous DNA, for reducing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  construct comprises a promoter operably linked to a DNA sequence which when expressed by a host produces an RNA having homology to at least one target mRNA expressed by the host and complementary RNA regions. The recombinant construct is useful for reducing the expression of a target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI; 2002-139927/18.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   recombinant constructs are also used in reducing expression of a target mRNA or any similar endogenous mRNA. The sequences and their reverse complements can be used to reduce the expression of any endogenous genomic sequence that shares substantial similarity to nucleic acid fragment which is in proximity to the DNA or RNA sequence derived from it. The present sequence is 1X ELVISLIVES complementary repeat region DNA found in plasmids pKS106 and pKS124 used in the exemplification of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a new recombinant construct. The construct comprises a promoter operably linked to a DNA sequence which when expressed by a host produces an RNA having homology to at least one target mRNA expressed by the host and complementary RNA regions. The recombinant construct is useful for reducing the expression of a target mRNA or any similar endogenous mRNA. The RNAs expressed from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New recombinant construct having a promoter operably linked to a sequence which when expressed produces an RNA having homology to mRNA and its reverse complement unrelated to endogenous DNA, for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Glassman KF,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  22-JUN-2001; 2001WO-US019962

                                                                                                                                                                                                                                                                                         ş
                                                                                                                                                                                                                                                                                                                                                                                                            proteins and polynucleotides encoding such proteins. The nucleic acid consequences may be used to increase the level of unsaturation in cellular lipids, including oil, in tissues when the enzyme is absent or rateliately, to isolate cDNAs and genes encoding homologous proteins from the same or other plant species and to create transgenic plants in which the polypeptides are present at higher or lower levels than normal or in cell types or developmental stages in which they are not normally found, thus altering the level of mono-, poly- and unsaturated fatty acids in those cells. They are useful as probes for genetic and physical gene mapping and as markers, e.g. restriction fragment length polymorphism (RFLP) markers. The peptides can be used to immunise animals to produce antibodies specific for the peptides and proteins. The present sequence is 1X ELVISILVES complementary repeat region DNA found in plasmids pKS106 and pKS124. This sequence is used in the exemplification of the invention of for the suppression of Fad2 in soybean

The present invention relates to diverged delta-9 fatty acid desaturase corrections and polynucleotides encoding such proteins. The nucleic acid sequences may be used to increase the level of unsaturation in cellular clipids, including oil, in tissues when the enzyme is absent or rate-limiting, to isolate cDNAs and genes encoding homologous proteins from the same or other plant species and to create transgenic plants in which the polymeptides are present at higher or lower levels than normal or in cell types or developmental stages in which they are not normally found, thus altering the level of mono-, poly- and unsaturated fatty acids in those cells. They are useful as probes for genetic and physical gene mapping and as markers, e.g. restriction fragment length polymorphism (RFIP) markers. The peptides can be used to immunise animals to produce antibodies specific for the peptides and proteins. The present sequence is 1X ELVISLIVES complementary repeat region DNA found in plasmids pKS106 and pKS124. This sequence is nearly in action in exemplification of the invention

                                                                                                                                                                                                                                                                                                                                                 문
                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to plastidic phosphoglucomutase polypeptides and CC their related nucleic acids. The sequences are useful for producing a CC transgenic plant, by transforming a plant cell with a polymucleotide of CC the invention and regenerating a plant from the transformed plant cell. CC Polymucleotide fragments are useful for suppressing the level of CC expression of a gene encoding a polypeptide having plastidic phosphoglucomutase activity. An isolated polymucleotide that affects the CC level of expression of a plastidic phosphoglucomutase polypeptide in a CC least 541 nucleotides, measuring the level of the polypeptide in the CC plant cell containing the polymucleotide, and comparing the level of the polypeptide in the CC plant cell containing the polymucleotide, and comparing the level of the containing the polymucleotide with the cell containing the polypeptide in a plant cell that does not contain the CC the level of the polypeptide in a plant cell that does not contain the cliscated polymucleotide. A method for altering the level of expression of CC a plastidic phosphoglucomutase protein in a host cell comprises CC cell under conditions that are suitable for expression of the chimeric CC gene, where the expression of the gene results in production of altered CC levels of plastidic phosphoglucomutase. This sequence represents an CC invention

                                                                 Ś
                                                                                                                                                                               The invention relates to plastidic phosphoglucomutase polypeptides and CC their related nucleic acids. The sequences are useful for producing a CC transgenic plant, by transforming a plant cell with a polynucleotide of CC the invention and regenerating a plant from the transformed plant cell. CC pólynucleotide fragments are useful for suppressing the level of CC expression of a gene encoding a polypeptide having plastidic CC phosphoglucomutase activity. An isolated polynucleotide that affects the CC level of expression of a plastidic phosphoglucomutase polypeptide in a CC level of expression of a plastidic phosphoglucomutase polypeptide in the plant cell can be identified by introducing a DNA fragment comprising at CC least 541 nucleotides, measuring the level of the polypeptide in the polypeptide in the polypeptide, and comparing the level of the polypeptide in the polypeptide in the plant cell containing the isolated polynucleotide with CC the level of the polypeptide in a plant cell that does not contain the CC isolated polynucleotide. A method for altering the level of expression of cell under conditions that are suitable for expression of the transformed CC cell under conditions that are suitable for expression of the chimeric gene, where the expression of the gene results in production of altered contained in the plastidic phosphoglucomutase. This sequence represents an of the chimeric particle.
                                                                                                        Query Match

The RNAs expressed from the recombinant constructs are also used in reducing expression of a target mRNA or any similar endogenous mRNA. The sequences and their reverse complements can be used to reduce the expression of any endogenous genomic sequence that shares substantial similarity to nucleic acid fragment which is in proximity to the DNA or RNA sequence derived from it. The present sequence is a PCR primer used for amplifying ELVISLIVES complementary region DNA used in the exemplification of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a new recombinant construct. The construct comprises a promoter operably linked to a DNA sequence which when expressed by a host produces an RNA having homology to at least one target mRNA expressed by the host and complementary RNA regions. The recombinant construct is useful for reducing the expression of a target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 7; Page 37; 77pp; English.

The construct comprises a promoter operably linked to a DNA sequence which when expressed by a host produces an RNA having homology to at least one target mRNA expressed by the host and complementary RNA regions. The recombinant construct is useful for reducing the expression of a target mRNA or any similar endogenous mRNA. The RNAs expressed from the recombinant constructs are also used in reducing expression of a target mRNA or any similar endogenous mRNA. The sequences and their reverse complements can be used to reduce the expression of any endogenous genomic sequence that shares substantial similarity to mucleic acid fragment which is in proximity to the DNA or RNA sequence derived from it. The present sequence is a PCR primer used for amplifying ELVISLIVES complementary region DNA used in the exemplification of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC Polynucleotide fragments are useful for suppressing the level of CC expression of a gene encoding a polypeptide having plastidic phosphoglucomutase activity. An isolated polynucleotide that affects the CC level of expression of a plastidic phosphoglucomutase polypeptide in a plant cell can be identified by introducing a DNA fragment comprising at CC least 541 nucleotides, measuring the level of the polypeptide in the CC plant cell containing the polynucleotide, and comparing the level of the polypeptide in the CC plant cell containing the polynucleotide, and comparing the level of the cC polypeptide in the polypeptide in a plant cell that does not contain the CC the level of the polypeptide in a plant cell that does not contain the CC the level of phosphoglucomutase protein in a host cell comprises CC a plastidic phosphoglucomutase protein in a host cell comprises CC cell under conditions that are suitable for expression of the chimeric gene, where the expression of the gene results in production of altered CC levels of plastidic phosphoglucomutase. This sequence represents an CC artificial DNA used for plasmid construction, in the methods of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to plastidic phosphoglucomutase polypeptides and CC their related nucleic acids. The sequences are useful for producing a CC transgenic plant, by transforming a plant cell with a polynucleotide of the invention and regenerating a plant from the transformed plant cell. CC polynucleotide fragments are useful for suppressing the level of CC expression of a gene encoding a polypeptide having plastidic phosphoglucomutase activity. An isolated polynucleotide that affects the CC level of expression of a plastidic phosphoglucomutase polypeptide in a CC level of expression of a plastidic phosphoglucomutase polypeptide in the plant cell can be identified by introducing a DNA fragment comprising at CC plant cell containing the polynucleotide, and comparing the level of the polypeptide in the plant cell containing the isolated polynucleotide with CC the level of the polypeptide in a plant cell that does not contain the CC polypeptide in the plant cell containing the isolated polynucleotide with CC the level of the polypeptide in a plant cell that does not contain the CC isolated polynucleotide. A method for altering the level of expression of a plastidic phosphoglucomutase protein in a host cell comprises CC transforming a host cell with a chimeric gene and growing the transformed CC cell under conditions that are suitable for expression of the chimeric gene and growing the chimeric containing the production of altered levels of plastidic phosphoglucomutase. This sequence represents an artificial DNA used for plasmid construction, in the methods of the
                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides the protein and coding sequences for the human brain T calcium channel alpha 1G and alpha 1I subunits. The alpha 1G subunit gene (designated CACNAIG) consists of 38 exons, and alternative processing leads to the production of 64 different proteins. The alpha 1I subunit (designated CACNAII) consists of 37 exons, and 8 proteins are produced due to alternative processing. The sequences provided by the invention are useful for screening drugs for use in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides the protein and coding sequences for the human brain T calcium channel alpha 1G and alpha 1I subunits. The alpha 1G subunit gene (designated CACNA1G) consists of 38 exons, and alternative processing leads to the production of 64 different proteins. The alpha 1I subunit (designated CACNA1I) consists of 37 exons, and 8 proteins are produced due to alternative processing. The sequences provided by the invention are useful for screening drugs for use in the
                                                                                                                                                                                                                                                                                                              26-MAY-1998;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Corn ear-derived polynucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                and development, disease resistance, environmental adaptability, quality, and yield of corn. The cdps are also useful as molecular markers for studying inheritance and multigene traits in a plant breeding program. The cpds are useful for producing purified corn-ear polypeptides by recombinant techniques. They are also useful in diagnostic assays to detect or confirm conditions or diseases associated with abnormal levels of cdp expression. ABX81541-ABX89140 represent corn ear-derived polynucleotides (cpds) of the invention. Note: The sequence data for this part and not form part of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to the isolation of corn ear-derived polynucleotides (cdps) from the corn (Zea mays) cDNA libraries SATMON022 and SATMON023. Some of the cpds uniquely identify structural, functional, and regulatory genes of corn ear. The polynucleotides sequences are useful for detecting cpds in a sample, for producing a corn ear-specific profile of gene transcription, for detecting altered gene expression in inbred or hybrid plants, and for screening several molecules for specific binding to the polynucleotide. The cdps are useful to identify, isolate, or extend identical or related corn-ear nucleic acid sequences from DNA libraries, and in nucleic acid amplification or hybridisation techniques to follow the expression of desirable traits through plant breeding programs. Preferably, the cdps are used to identify, evaluate, alter, or follow the inheritance of desired characteristics associated with growth and development disease aresistance environmental adaptability.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cc useful for detecting cpds in a sample, for producing a corn ear-specific cc profile of gene transcription, for detecting altered gene expression in cc inbred or hybrid plants, and for screening several molecules for specific binding to the polynuclectide. The cdps are useful to identify, isolate, or extend identical or related corn-ear nucleic acid sequences from DNA cc libraries, and in nucleic acid amplification or hybridisation techniques to follow the expression of desirable traits through plant breading cc programs. Preferably, the cdps are used to identify, evaluate, alter, or cf follow the inheritance of desired characteristics associated with growth can development, disease resistance, environmental adaptability, quality, and yield of corn. The cdps are also useful as molecular markers for cstudying inheritance and multigene traits in a plant breeding program. The cpds are useful for producing urrified corn-ear polypeptides by crecombinant techniques. They are also useful in diagnostic assays to detect or confirm conditions or diseases associated with abnormal levels of cdp expression. ABX81541-ABX99140 represent corn ear-derived copolynuclectides (cpds) of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained corn electronic format directly from the USPTO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches

This can be used to screen for agents which modulate the activity of glutamate receptor delta-1 subunit polypeptide, which may then be used in the treatment of diseases such as epilepsy, brain damage, neurodegenerative disorders such as Alzheimer's disease, Huntington's disease, and Parkinson's disease, schizophrenia, mood disorders, pain, neuropathologic pain and dementias. The present sequence is a fragment of the human glutamate receptor delta-1 subunit coding sequence
                                                                                                                         Human; glutamate receptor delta-1 subunit; epilepsy; brain damage; neurodegenerative disorder; Huntington's disease; Parkinson's disease; Alzheimer's disease; schizophrenia; mood disorder; dementia;

This can be used to screen for agents which modulate the activity of glutamate receptor delta-1 subunit polypeptide, which may then be used in the treatment of diseases such as epilepsy, brain damage, neurodegenerative disorders such as Alzheimer's disease, Huntington's disease, schizophrenia, mood disorders, pain, neuropathologic pain and dementias. The present sequence is a fragment of the human glutamate receptor delta-1 subunit coding sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention provides a human glutamate receptor delta-1 subunit polypeptide. This can be used to screen for agents which modulate the activity of glutamate receptor delta-1 subunit polypeptide, which may then be used in the treatment of diseases such as epilepsy, brain damage, neurodegenerative disorders such as Alzheimer's disease, Huntington's disease and Parkinson's disease, schizophrenia, mood disorders, pain, neuropathologic pain and dementias. The present sequence is a fragment of the human glutamate receptor delta-1 subunit coding sequence
                                                                                                                                             Novel human glutamate receptor delta-1 subunit protein which can be regulated for treating epilepsy, schizophrenia, neurodegenerative diseases, ischemia, pain, benign prostate hyperplasia and urinary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel human glutamate receptor delta-1 subunit protein which can be regulated for treating epilepsy, schizophrenia, neurodegenerative diseases, ischemia, pain, benign prostate hyperplasia and urinary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               neurodegenerative disorder; Huntington's disease; Parkinson's disease, Alzheimer's disease; schizophrenia; mood disorder; dementia; neuropathological pain; pain; receptor; anticonvulsant; nootropic;

                                                 mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                polypeptide. This can be used to screen for agents which modulate the activity of glutamate receptor delta-1 subunit polypeptide, which may then be used in the treatment of diseases such as epilepsy, brain damag neurodegenerative disorders such as Alzheimer's disease, Huntington's disease and Parkinson's disease, schizophrenia, mood disorders, pain, neuropathologic pain and dementias. The present sequence is a fragment the human district and communities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               gene therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     06-OCT-2000

                                                                                                              The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted protesins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors

                                                                                                                                                                                                                                                                                                                                                                            The invention relates to human breast cancer expressed polynucleotides (AALO'544-AAL26789) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and polypeptides are also useful for isolating compounds with cytostatic polypeptides are also useful for isolating compounds with cytostatic
                                                                                                                                                                                                                                                                                                                Sequence 170
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 1; Page 1753; 3695pp; English.
